

These washing instructions apply to the following product lines:

HAVEP Protector PRO, Multiprotector, Multiprotector+, and Multishield

The HAVEP product lines mentioned may be inherently flame retardant, which means that the fabric is flame retardant due to the fibers used (aramid fibers and a blend with modacrylic fibers). In addition, the fabric has a repellent fluorocarbon finish. Protective clothing from "HAVEP" is certified in accordance with European Regulation (EU) 2016/425 for personal protective equipment. The standards that apply to the garment can be found on the standard label. We therefore also refer to the "user instructions" that come with each garment. These user instructions explain the pictograms and performance levels and provide a number of general (washing) recommendations.

General:

- By following the washing and care instructions, you will extend the life of the garment and better preserve its protective properties. This should preferably be done at a professional industrial laundry.
- Sort the laundry preferably by color and/or soiling.
- Therefore, always wash and dry clothing made of the same fiber composition/ratio.
- Soiling of the clothing can reduce its (flame-retardant) properties.
- Never store clothing in a dirty condition. Wash clothing regularly to prevent stains from setting. Clothing should also not be stored in solvents, washing solutions, disinfectants, or stain removers.
- Close zippers and Velcro fasteners before washing to prevent damage during washing (and possibly pressing).
- Use soft water for washing and rinsing. Remove any detergent residue from previous washes from the soap dispenser and machine. Soap residue can have a negative effect on the protective properties.
- Do not iron reflective strips and seal emblems.
- Detergents with a higher pH in combination with a higher temperature provide better cleaning results. A higher pH does not have a negative effect on the flame-retardant properties. However, the color fastness and appearance of the clothing may be affected.
- Do not use fabric softeners.
- Make sure that the dryer is not overloaded and that the outlet temperature does not exceed 0°C (1 dot).

Washing symbols on the label:

Deviations from these symbols are possible, for example due to the lining or trimmings. Check the label in your clothing to see which washing instructions apply.

Industrial washing ISO 15797:

The fabric and reflective tape have been tested for washing and drying in accordance with ISO 15797.

Water and chemical repellent finishes:

The **Protector Pro, Multiprotector, Multiprotector+, and Multishield** are equipped with a water-repellent or fluorocarbon finish. To maintain these repellent properties after washing, a few recommendations apply:

- Wash clothing with a repellent finish separately.
- Remove any detergent residue from previous washes from the soap dispenser and machine. Soap residue can have a negative effect on the protective properties.
- Do not use fabric softeners.
- Ironing helps to reactivate the repellent properties. (Note: do not iron reflective strips and seal emblems.)
- After a number of washes, the repellent properties will diminish. We therefore recommend having the repellent finish reapplied after 5 washes in your laundry. Consult your detergent supplier for the right products and instructions.

This advice has been compiled with the utmost care by HAVEP. HAVEP is not liable for damage resulting from failure to follow this washing advice.

incorrectly following these washing recommendations. Furthermore, no rights can be derived from these recommendations.
